I think you have it covered. I think we are now about ppb and I think that is going to be gc/MS with extraction. The extraction is similar to UDA so Eric should be in familiar ground. Just a matter of leaving the filament off a little longer with hexane but I am sure he will think of that or his GC/MS will quickly remind him.

Other than what we are doing - gc/ms, lc/ms, hplc/uv, gc/ir, would you recommend any other tests?

Also, Jennie brought up a possible concern - effect of chlorination on these PPH compounds. I'll send you the structures once my computer connects to network drives.

Cindy

Eric has already left for the day. I'm typing all this up - we have a factsheet started. Should have it out later tonight.

Was EricG on the call this afternoon...so he knows 100 mL samples with 15 gm. NaCl with 1 mL hexane; no concentration; no drying if GC/MS can take 2uL injection of that floating extract which really should have very little water. Much like the UDA protocol. One trick would be the extraction containers. If the large glass tubes we used to break emulsions with in the centrifuge with glass stopper those might work. I know he is an early bird...do you know his ETA? My contact number for him Ex. 6 - Personal Privacy is coming up as a non-working number do you have another # for him and I will check with him this evening. Don't want to butt in but if he wants company and help I will be there. Thanks, JoeS

Eric and Jennie are coming in tomorrow morning. Maybe call them in morning to see if they need help. I might come in for a little too. I could use help in capturing everything since there is so much info and players involved.

Glad you could make the call.
